In mathematics, an algebraic differential equation is a differential equation that can be written as a polynomial equation in the unknown function and its derivatives. The theory of D-modules is a global theory of linear differential equations, and has been developed to include partial differential equations. This case stands in relation with the whole theory roughly as invariant theory does to group representation theory. Algebraic differential equation - Wikipedia. In contrast to the classical approach, differential invariants are defined on jet bundles. Therefore, following [9] symmetry groups and group invariant solutions of partial differential equations. It is even crucial in many scientific fields (e.g. control theory or experimental physics). Definition 2 (Algebraic Invariant Equation (Initial Value Problem)).
